History: 2010/11/01: First Version

Requires: ImageJ 1.30m or newer

Source: Substack_Maker_Plus.java

Installation: Download Substack_Maker_Plus.class to the plugins folder and restart ImageJ

Description: This plugin is based on the Substack Maker plugin by Anthony Padua and Daniel Barboriak available from the ImageJ Plugins download page. The plugin extracts selected images from a stack to make a new substack. In addition to allowing a range of images (e.g. 2-14) or a list of images (e.g. 2,5,7,10), a sequence of images can also be extracted, such as every third image starting with image 1 (i.e. 1+3) where the first number is the starting image number and the number after the + sign is the frequency (every other = 2, every third = 3, every fourth = 4 etc.).
